Transient Execution Emulator

Meltdown and Spectre Behind the Scenes

Felix Betke, Lennart Hein, Melina Hoffmann, Jan-Niklas Sohn 2022-04-01

Rheinische Friedrich-Wilhelms-Universität Bonn

Structure

- Topic
- Background
- · Our task & approach
- Implementation
- · Demos:
 - · Meltdown
 - · Spectre
- Conclusion

Topic

- · Lab builds on SCA lecture
- Meltdown and Spectre mostly patched
- · Difficult to experiment with
 - · Personal computer often times not usable
- Goal: Vulnerable CPU Emulator that runs on many systems
 - · Should offer a gdb-like interface

Background

- Frontend:
 - · Fetches/Decodes instructions, maintains queue
 - Branch prediction
- · Execution Engine:
 - · Multiple sets of execution units
- Memory Subsystem:
 - · Handles memory operations
 - · Maintains L1 cache
 - Ensures data is loaded from other caches/memory

Out-of-order execution

- Independent instruction streams
- · Tomasulo algorithm:
 - Reservation stations
 - · Common Data Bus
- Rollbacks

Speculative execution

- · Predict results of branch instructions
- Prevent stalls
- · BPU maintains counters
- Rollbacks

Meltdown

- · Abuses out-of-order execution
- Meltdown-US-L1:
 - · Define oracle array
 - · Perform illegal read to steal secret
 - · Embded secret-dependent oracle entry into cache
 - · Await rollback and measure oracle access times
- · Small time window

Spectre

- · Abuses speculative execution
- · Different variations. Here: prediction of conditional branch instrs.
- · Spectre v1: Deliberately train BPU used by victim process
- · Make victim leak secret into cache
- Direct consequence of speculative execution

Mitigations: Meltdown

- · Disable out-of-order execution
- Intel's microcode mitigation
 - Microprograms
- \cdot OS mitigations

Mitigations: Spectre

- Disable speculative execution:
 - · Completely disable
 - fence instructions
- Flush entire cache after rollback

Our task

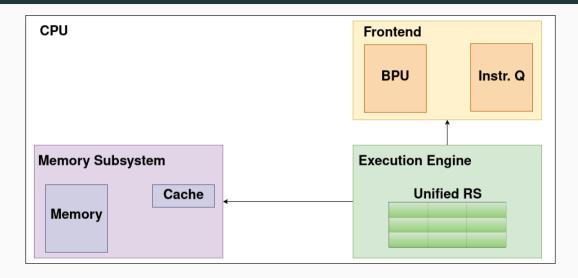

- · Develop graphical CPU emulator vulnerable to:
 - · Our version of Meltdown-US-L1
 - · Spectre v1
- Must support single step, out-of-order, and speculative execution
- · Implement Intel's microcode mitigation
- Other mitigations via microprograms
- · Target audience: SCA students
 - Or anyone with basic knowledge of TE attacks

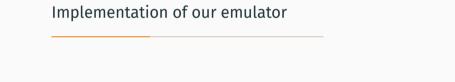

Our approach

How we started

- · Must-haves, nice-to-haves, future work
- · At time of Meltdown/Spectre publication: Skylake
- Filter components needed for our Meltdown/Spectre versions
- Build simplified CPU

Our version

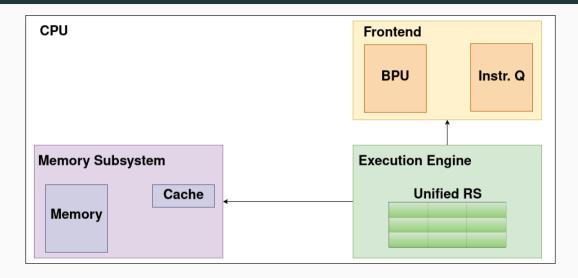

Implementation of our emulator

- · overview over our whole emulator
- · Out-of-order execution
- · Speculative execution
- Fault handling and rollbacks

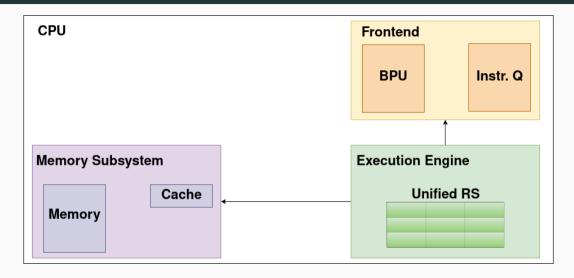

CPU class

Parser

- · Assembler style source code
- Arithmetic, branch and memory instructions, fence, rtdsc
- Provides an instruction list
- · Only one type of instructions

CPU components

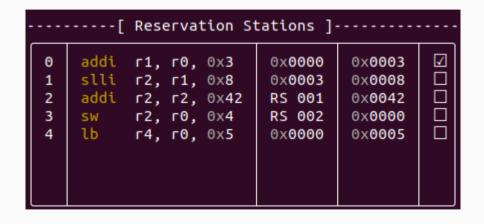

Out-of-order execution

- · Execution engine
- Tomasulos algorithm
 - · Unified reservation station
 - · Instructions wait for their operands
 - Keeping track of operands and results

Issuing instructions

- Resolve operands and target register
- Two kinds of register values: Word and SlotID
- Put register content into operand list
- Put SlotID into target register

Example Reservation Station

Common Data Bus (CDB)

- · Execute instructions in reservation station
- · Broadcast the result over the CDB
 - Registers
 - · Reservation station slots
 - $\boldsymbol{\cdot}$ At most once per cycle

Speculative execution

- Predict outcome of branch instructions
- · Resume execution based on this prediction
- Two central components
 - Branch prediction unit (BPU)
 - · CPU frontend with instruction queue

Branch Prediction Unit (BPU)

- · Simplified version
- Array of predictions
- \cdot 2-bit-saturating counter to handle predictions

CPU frontend with instruction queue

- · Interface between instruction list and execution unit
- Involved in speculative execution
- Manages instruction queue

                                                                       RS 004
                                                                                        \overline{\Box}
                                                         г4, г0, 8
                                                                       RS 006
                                                                                0×0000
```

Faults and Rollbacks

- Microarchitectural fault situation that has to be handled bevore we can resume our execution
 - Mispredicted branches
 - Attempt to access inaccessible memory
- · Have to handle the effects of transient execution

Rollback

- Only rollback the register state and the memory contents
- · No rollback in Cache and BPU
- · Restore register state via snapshots
- Prevent memory rollbacks by executing stores in-order
- · Handle faults in program order

Rollback after mispredicted branch

```
-[ Program ]-----
                          -[ Oueue ]-----

Spectre-Type Attack Demo

- · Demonstrate mechanism behind Spectre-type attacks
- BPU can be trained for targeted misprediction
- $\boldsymbol{\cdot}$ Requires code sequence that encodes leaked value into cache

Spectre-Type Attack: Overview

- Prepare victim array: 8 elements, all **0x01**
 - Followed by secret value 0x41
- Victim loops over the array and encodes each value into the cache
 - BPU is trained to predict that the loop continues
- · Final loop condition will be mispredicted
 - · During transient execution: Additional iteration with out-of-bounds index
 - · Secret value accessed and encoded into cache

Spectre-Type Attack: Preparation

```
// Set up array at 0x1000, 8 elements, all 0x01
addi r1. r0. 0x1000
addi r2, r0, 0x01
sb r2, r1, 0
sb r2, r1, 1
sb r2, r1, 2
sb r2. r1. 3
sb r2, r1, 4
sb r2, r1, 5
sb r2, r1, 6
sb r2, r1, 7
// Followed by one out-of-bounds 0x41 value
addi r2. r0. 0x41
sb r2, r1, 8
```

Spectre-Type Attack: Execution

```
// Loop over array, encode every value in cache
addi r2, r0, 0 // r2: Loop index
addi r3, r0, 8 // r3: Array length
loop:
// Load array element
lb r4, r2, 0x1000
// Encode value in cache
slli r4, r4, 4
lb r4, r4, 0x2000
// Increment loop index
addi r2, r2, 1
// Loop while index is in bounds
bne r2, r3, loop
```

Attack Demo

Spectre-Type Attack: Mitigation

- · Flush cache after rollback
- · Prevents using cache as transmission channel
- Implementation: Inject microcode after rollback
 - Inject flushall instruction after mispredicted branch

Mitigation Demo

Conclusion

- · Goal: CPU Emulator
 - · Out-of-Order Execution
 - · Branch Prediction
 - · Transient Execution Attacks
 - Mitigations

Further Work

- More Spectre and Meltdown variants
 - · Meltdown: Load, Store, Line-Fill Buffers
 - · Spectre: elaborate BPU
- Multiple execution contexts
- · Operating System
- UI Improvements
