## Transient Execution Emulator

Meltdown and Spectre Behind the Scenes

Felix Betke, Lennart Hein, Melina Hoffmann, Jan-Niklas Sohn 2022-04-01

Rheinische Friedrich-Wilhelms-Universität Bonn

#### Structure

- Topic
- Background
- · Our task & approach
- Implementation
- · Demos:
  - · Meltdown
  - · Spectre
- Conclusion

## Topic

- · Lab builds on SCA lecture
- Meltdown and Spectre mostly patched
- · Difficult to experiment with
  - · Personal computer often times not usable
- Goal: Vulnerable CPU Emulator that runs on many systems
  - · Should offer a gdb-like interface

# Background

- Frontend:
  - · Fetches/Decodes instructions, maintains queue
  - Branch prediction
- · Execution Engine:
  - · Multiple sets of execution units
- Memory Subsystem:
  - · Handles memory operations
  - · Maintains L1 cache
  - Ensures data is loaded from other caches/memory

## Out-of-order execution

- Independent instruction streams
- · Tomasulo algorithm:
  - Reservation stations
  - · Common Data Bus
- Rollbacks

# Speculative execution

- · Predict results of branch instructions
- Prevent stalls
- · BPU maintains counters
- Rollbacks

#### Meltdown

- · Abuses out-of-order execution
- Meltdown-US-L1:
  - · Define oracle array
  - · Perform illegal read to steal secret
  - · Embded secret-dependent oracle entry into cache
  - · Await rollback and measure oracle access times
- · Small time window

#### Spectre

- · Abuses speculative execution
- · Different variations. Here: prediction of conditional branch instrs.
- · Spectre v1: Deliberately train BPU used by victim process
- · Make victim leak secret into cache
- Direct consequence of speculative execution

# Mitigations: Meltdown

- · Disable out-of-order execution
- Intel's microcode mitigation
  - Microprograms
- $\cdot$  OS mitigations

# Mitigations: Spectre

- Disable speculative execution:
  - · Completely disable
  - fence instructions
- Flush entire cache after rollback

#### Our task

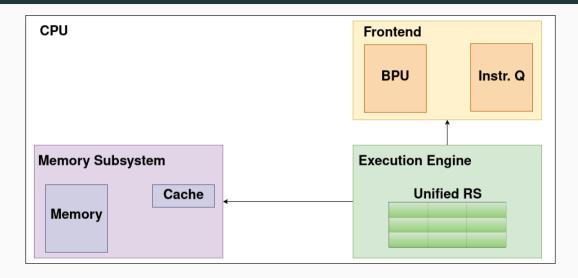

- · Develop graphical CPU emulator vulnerable to:
  - · Our version of Meltdown-US-L1
  - · Spectre v1
- Must support single step, out-of-order, and speculative execution
- · Implement Intel's microcode mitigation
- Other mitigations via microprograms
- · Target audience: SCA students
  - Or anyone with basic knowledge of TE attacks

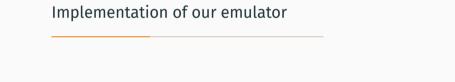

# Our approach

#### How we started

- · Must-haves, nice-to-haves, future work
- · At time of Meltdown/Spectre publication: Skylake
- Filter components needed for our Meltdown/Spectre versions
- Build simplified CPU

## Our version

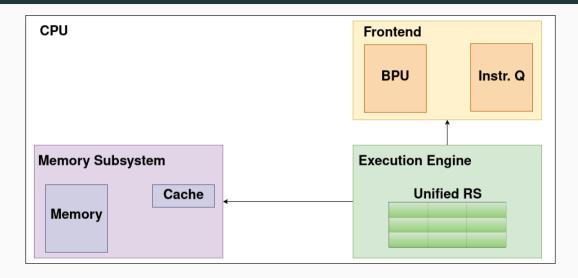

## Implementation of our emulator

- · overview over our whole emulator
- · Out-of-order execution
- · Speculative execution
- Fault handling and rollbacks

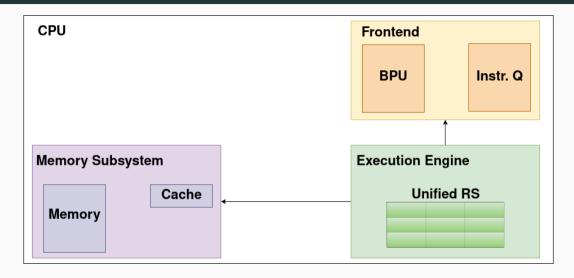

## **CPU** class

#### Parser

- · Assembler style source code
- Arithmetic, branch and memory instructions, fence, rtdsc
- Provides an instruction list
- · Only one type of instructions

## **CPU** components

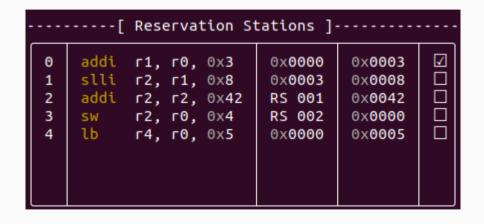

#### Out-of-order execution

- · Execution engine
- Tomasulos algorithm
  - · Unified reservation station
  - · Instructions wait for their operands
  - Keeping track of operands and results

## Issuing instructions

- Resolve operands and target register
- Two kinds of register values: Word and SlotID
- Put register content into operand list
- Put SlotID into target register

#### **Example Reservation Station**

## Common Data Bus (CDB)

- · Execute instructions in reservation station
- · Broadcast the result over the CDB
  - Registers
  - · Reservation station slots
  - $\boldsymbol{\cdot}$  At most once per cycle

## Speculative execution

- Predict outcome of branch instructions
- · Resume execution based on this prediction
- Two central components
  - Branch prediction unit (BPU)
  - · CPU frontend with instruction queue

## Branch Prediction Unit (BPU)

- · Simplified version
- Array of predictions
- $\cdot$  2-bit-saturating counter to handle predictions

## CPU frontend with instruction queue

- · Interface between instruction list and execution unit
- Involved in speculative execution
- Manages instruction queue

                                                                                0×0000
```

#### Faults and Rollbacks

- Microarchitectural fault situation that has to be handled bevore we can resume our execution
  - Mispredicted branches
  - Attempt to access inaccessible memory
- · Have to handle the effects of transient execution

#### Rollback

- Only rollback the register state and the memory contents
- · No rollback in Cache and BPU
- · Restore register state via snapshots
- Prevent memory rollbacks by executing stores in-order
- · Handle faults in program order

## Rollback after mispredicted branch

```
-[ Program ]-----
                          -[ Oueue ]-----

#### Spectre-Type Attack Demo

- · Demonstrate mechanism behind Spectre-type attacks
- BPU can be trained for targeted misprediction
- $\boldsymbol{\cdot}$  Requires code sequence that encodes leaked value into cache

## Spectre-Type Attack: Overview

- Prepare victim array: 8 elements, all **0x01** 
  - Followed by secret value 0x41
- Victim loops over the array and encodes each value into the cache
  - BPU is trained to predict that the loop continues
- · Final loop condition will be mispredicted
  - · During transient execution: Additional iteration with out-of-bounds index
  - · Secret value accessed and encoded into cache

# Spectre-Type Attack: Preparation

```
// Set up array at 0x1000, 8 elements, all 0x01
addi r1. r0. 0x1000
addi r2, r0, 0x01
sb r2, r1, 0
sb r2, r1, 1
sb r2, r1, 2
sb r2. r1. 3
sb r2, r1, 4
sb r2, r1, 5
sb r2, r1, 6
sb r2, r1, 7
// Followed by one out-of-bounds 0x41 value
addi r2. r0. 0x41
sb r2, r1, 8
```

## Spectre-Type Attack: Execution

```
// Loop over array, encode every value in cache
addi r2, r0, 0 // r2: Loop index
addi r3, r0, 8 // r3: Array length
loop:
// Load array element
lb r4, r2, 0x1000
// Encode value in cache
slli r4, r4, 4
lb r4, r4, 0x2000
// Increment loop index
addi r2, r2, 1
// Loop while index is in bounds
bne r2, r3, loop
```

Attack Demo

# Spectre-Type Attack: Mitigation

- · Flush cache after rollback
- · Prevents using cache as transmission channel
- Implementation: Inject microcode after rollback
  - Inject flushall instruction after mispredicted branch

Mitigation Demo

## Conclusion

- · Goal: CPU Emulator
  - · Out-of-Order Execution
  - · Branch Prediction
  - · Transient Execution Attacks
  - Mitigations

## **Further Work**
